Multimodal Teaching and Learning-Gunther Kress 2014-09-11 This book takes a radically different look at communication, and in doing so presents a series of challenges to accepted views on language, on communication, on teaching and, above all, on learning. Drawing on extensive research in science classrooms, it presents a view of communication in which language is not necessarily communication - image, gesture, speech, writing, models, spatial and bodily codes. The action of students in learning is radically rethought: all participants in communication are seen as active transformers of the meaning resources around them, and this approach opens a new window on the processes of learning.

Pathophysiology-Carie Ann Braun 2007 This pathophysiology text offers a unique conceptual approach that facilitates learning by viewing pathophysiology as health care professionals do. Students will learn about general mechanisms of disease or alterations in human function—such as immune alterations or altered nutrition—and apply these processes to specific conditions. Chapters focus on fifteen core concepts of altered human function, selected by analyzing and clustering health conditions with high prevalence, incidence, and severity. Unlike a traditional systems-based approach, this novel approach shows how most diseases involve multiple body systems. A bound-in CD-ROM includes animations and an interactive game. Mapping Biology Knowledge-K. Fisher 2006-04-11 *Mapping Biology Knowledge* addresses two key topics in the context of biology, promoting meaningful learning and knowledge mapping as a strategy for achieving this goal. Meaning-making and meaning-building are examined from multiple perspectives throughout the book. In many biology courses, students become so mired in detail that they fail to grasp the big picture. Various strategies are proposed for helping instructors focus on the big picture, using the 'need to know' principle to decide the level of detail students must have in a given situation. The metacognitive tools described here serve as support systems for the mind, creating an arena in which learners can operate on ideas. They include concept maps, cluster maps, webs, semantic networks,

and conceptual graphs. These tools, compared and contrasted in this book, are also useful for building and assessing students' content and cognitive skills. The expanding role of computers in mapping biology knowledge is also explored.

Understanding and Developing Science Teachers' Pedagogical Content Knowledge-John Loughran 2012-07-31 There has been a growing interest in the notion of a scholarship of teaching. Such scholarship is displayed through a teacher's grasp of, and response to, the relationships between knowledge of content, teaching and learning in ways that attest to practice as being complex and interwoven. Yet attempting to capture teachers' professional knowledge is difficult because the critical links between practice and knowledge, for many teachers, is tacit. Pedagogical Content Knowledge (PCK) offers one way of capturing, articulating and portraying an aspect of the scholarship of teaching and, in this case, the scholarship of science teaching. The research underpinning the approach developed by Loughran, Berry and Mulhall offers access to the development of the professional knowledge of science teaching in a form that offers new ways of sharing and disseminating this knowledge. Through this Resource Folio approach (comprising CoRe and PaP-eRs) a recognition of the value of the specialist knowledge and skills of science teaching is not only highlighted, but also enhanced. The CoRe and PaP-eRs methodology offers an exciting new way of capturing and portraying science teachers' pedagogical content knowledge so that it might be better understood and valued within the profession. This book is a concrete example of the nature of scholarship in science teaching that is meaningful, useful and immediately applicable in the work of all science teachers (preservice, in-service and science teacher educators). It is an excellent resource for science teachers as well as a guiding text for teacher education. Understanding teachers' professional knowledge is critical to our efforts to promote quality classroom practice. While PCK offers such a lens, the construct is abstract. In this book, the authors have found an interesting and engaging way of making science teachers' PCK concrete, useable, and meaningful for researchers and teachers alike. It offers a new and exciting way of understanding the importance of PCK in shaping and improving science teaching and learning. Professor Julie Gess-Newsome Dean of the Graduate School of Education Willamette University This book contributes to establishing CoRes and PaP-eRs as immensely valuable tools to illuminate and describe PCK. The text provides concrete examples of CoRes and PaP-eRs completed in "real-life" teaching situations that make stimulating reading. The authors show practitioners and researchers alike how this approach can develop high quality science teaching.
